Respiratory diseases constitute a significant burden of morbidity and mortality in India. The spectrum of childhood respiratory diseases in India has undergone considerable expansion over the past few decades. From a situation where infectious conditions of upper and lower respiratory tract predominated, there is currently a wide range of problems including congenital malformations, allergic conditions such as asthma & allergic rhinosinusitis, Tuberculosis & drug resistant TB, Bronchiectasis, genetic disorders like cystic fibrosis, primary ciliary disorders that are now recognized to be prevalent in the country in significant proportions.

A three-year postgraduate (MD) degree in pediatrics lends adequate exposure and skills to train a doctor in managing multitudes of pediatric diseases including respiratory. However, with a growing expanse in medical knowledge and recognition of many complex and chronic respiratory diseases that demand a more detailed and extensive clinical and investigative approach, which often is beyond the scope of postgraduation training

A super specialty program in the form of a fellowship training in pediatric pulmonology envisages to fulfil the felt need to build capacity in the country of specialists that have specialized training to recognize and provide a comprehensive care for children with complex, chronic respiratory morbidities

8. Background

In the initial stages, piles (Haemorrhoids) are best treated with non-surgical treatment. At Healing Hands Clinic, we offer MCDPA for the same which is an acronym for Medicines (Herbal), Constac (Ayurvedic laxative powder), Dietary changes, Physiotherapy and Ayurvedic oil therapy. However, once the disease progresses to grade 2, something more needs to be done to provide a permanent cure. Here comes the role of Laser, one of modern science's boon to humanity. Laser has changed the way we treat a lot of conditions, be it eyes, kidneys or skin. Fortunately, anorectal conditions are on that list and thus, treating conditions like piles, fistula, fissure, has become much easier compared to the past.

WHO SHOULD UNDERGO LASER TREATMENT FOR PILES?

Piles, medically known as haemorrhoids, are divided into 4 grades depending upon their severity.

Grade 1 is the initial stage where a person has bleeding or itching but no prolapse. As mentioned earlier, it is treated with MCDPA.

Grade 2 is where the mass of haemorrhoids begins to come out of the anal opening (prolapse) during defecation but goes back in, on completion of the act. Many a times in Grade 2, especially if your doctor suggests so, a trial of MCDPA is given with an expectation that it would get cured. In case of failure of MCDPA, or if your doctor deems it necessary at diagnosis itself, Laser Haemorrhoidoplasty (LHP) is done.

In Grade 3, the prolapsed haemorrhoidal mass does not go back on its own, but needs to be manually pushed back. Laser Haemorrhoidoplasty (LHP) is done in the early stages of Grade 3, the later stages would most often need a Stapler Surgery.

Most of the cases of Grade 2 and early stages of Grade 3 haemorrhoids are treated with Laser Haemorrhoidoplasty

IS LASER HAEMORRHOIDOPEXY A COMPLICATED SURGERY? HOW DOES IT WORK?

If the definition of surgery is 'cuts and stitches' for you, then it isn't even a surgery ! That's the beauty of Laser. No incisions (cuts) and no suturing (stitches) !

Leonardo Laser is a Diode laser. Its fiber is passed through the natural anal opening and laser energy is applied to the haemorrhoidal mass. This controlled emission of laser energy reaches the submucosal zone, causing the haemorrhoidal mass to shrink. In addition, fibrotic reconstruction generates new connective tissue which ensures that the mucosa adheres to the underlying tissue. This prevents the recurrence of prolapse. No foreign material is left in the body following the procedure.

Leonardo Laser was first introduced in India by Dr Ashwin Porwal at Healing Hands Clinic (HHC). A record number of cases are treated at HHC per month.

LASER HAS REMARKABLE BENEFITS

As mentioned earlier, Laser Haemorrhoidoplasty has no cuts or incisions.

The post-operative pain is a lot less compared to other procedures. In fact, patients describe it more as 'burning' rather than pain, which lasts around 3-4 days.

Healing is excellent as there are no cuts or stitches

There is no urgency (a feeling of having to rush to the toilet) after the procedure.

There is no risk of rectal stenosis.

Being a simple procedure, one can return to normal activities within a short span of time (3rd day in case of sedentary job)

DOES LASER HAVE ANY UNTOWARD EFFECTS?

There may be some burning for 3-4 days as discussed above. A rare problem (5% cases) is external skin tag thrombosis which is easily manageable with excision.

Laser proctology refers to the treatment of the common condition of anus and rectum.

We have started laser treatment of-

- Hemorrhoids
- Fissures
- Fistulas and
- Pilonidal Sinus

Why is laser surgery better than the conventional surgery?

The laser is the latest modality for fissures, fistulas, and piles. It is a daycare procedure that offers several advantages over traditional surgery.

- Less operation time
- Discharge within a few hours
- Go back to a normal routine within a day or two
- Great surgical precision
- Faster recovery
- Significantly less post-operative pain
- Less recurrence rates
- Anal sphincter is well preserved (no chances of incontinence/ fecal leak)
- Piles

Laser Haemorrhoidectomy

Laser cauterization is a technique in which the surgeon uses a narrow beam of the laser to focus only on hemorrhoid and not damage the nearby tissues. It is a safe procedure with minimal bleeding and quick healing time. The controlled emission of laser energy reaches the submucosa zone, causing the haemorrhoidal mass to shrink. Fibrotic reconstruction generates new connective tissue, ensuring the mucosa adheres to the underlying tissue preventing the recurrence of prolapse.

Fistulas

FILAC technique (Fistula – Tract Laser Closure)

It is a minimally invasive and sphincter-preserving technique used in treating anorectal fistula. The affected tissue (epithelialized path) is destroyed and sealed using laser emission radially 360° in a controlled manner. Laser energy is delivered into the anal fistula tract which induces destruction of the fistula epithelium and simultaneous obliteration of the remaining fistula tract by a shrinkage effect. The epithelialized tissue is being destroyed in a controlled way and the fistula tract collapses to a very high degree. Using radial fiber gives good control to the operator and also allows use in the convoluted track.

Fissure

The laser fissure procedure is done under local anesthesia. It doesn't require hospitalization of a patient. By the use of laser, pathological tissue of anal fissure is vaporized. The laser removal of the fissure has great efficiency rate. It is the most modern technique to treat a fissure. The laser surgery is the perfect alternative for the other methods.

Pilonidal Sinus

Contrary to the conventional methods, the laser treats pilonidal sinuses in depth. It is literally a non-invasive, completely painless and very therapeutic effect of laser that contributes noticeably to the spectacular healing of pilonidal sinus disease. Laser removes the inflamed structures and the sinuses. The removal of pilonidal sinuses with this laser surgical technique takes approximately 30 minutes in most cases. When we laser the sinus tracts, collateral damage is minimal. The healing process is thus quicker, easier and mostly without any pain. Chances of recurrences are minimal.

STAPLER HEMORRHOIDOPEXY

The Stapler surgery was developed by world-renowned colorectal surgeon, Dr Antonio Longo. It is currently the gold standard for treating Grade 3 and 4 piles. In this procedure, a circular stapler device is used to 'lift up' or reposition the prolapsed mucosa and to reduce blood flow to the internal hemorrhoids. These internal hemorrhoids then shrink in a few weeks.

How is Stapler Haemorrhoidopexy better than traditional haemorrhoidectomy?

Stapler surgery is associated with much less pain than the traditional technique. This is because in Stapler surgery, the operating field is above the sensitive portion of the anal canal (i.e. above the dentate line. A person has sensations below the dentate line). In the traditional haemorrhoidectomy done using scalpel and sutures, the area below the dentate line is operated upon, affecting many sensitive nerve endings, typically causing a lot of pain.

Advantages of Stapler Haemorrhoidopexy

- Short operating time
- Minimal blood loss
- Less post-operative complications like pain, bleeding
- Short hospital stays
- Early return to work

Risks involved in Stapler Haemorrhoidopexy

Although uncommon, Stapler surgery may have some drawbacks. These are further minimized when performed by an experienced surgeon. The risks include but are not limited to:

- Feeling of needing to rush to the toilet.
- Bleeding
- Staple line stricture
- Infection

9. Course Methodology & Syllabus

- Training is being conducted as per teaching / training schedule prepared by the supervisor/guide and subsequently approved by SHFCP.
- There is a defined process of training which includes:
 - Hands on training by observing procedures and surgeries, case presentation during clinical meetings, observations, training through simulator and videos
 - Clinical training is imparted through Clinical Meetings/ CMEs/ Departmental Meetings/ Symposiums and bed side case presentation. Fellows can join Journal club.
- Final Examination/ Evaluation

There is a defined process of final examination/evaluation. Final examination is being conducted at the end of the six months/ one year of fellowship program by one external examiner and one internal examiner. Clinical Fellows who have successfully completed their training and examination were conferred with certificate of Clinical Fellowship of SHFCP in the respective specialty.
